(54) LIQUID CRYSTAL DISPLAY ELEMENT

(57)Abstract:

PROBLEM TO BE SOLVED: To provide an inexpensive element of a color display type with which the display performance and yield are improved without using plastic beads and the number of stages is decreased.

SOLUTION: Columnar spacers 33 disposed on a counter substrate 30 are pressed onto the wiring layer of an active matrix substrate 10 and more particularly the wiring layer of the lowermost layer 13 to maintain the insulation. In such a case, by constituting the spacers 33 of the laminates of colored layers and in addition, forming resists into shape having overhangs by photolithography, the formation of conductive layers on flanks is averted and, therefore, the free selection of the contact positions is made possible, and further by

forming the spacers out of the laminates of the colored layers of the diameters larger toward the upper layers, the processing stages are decreased. The wiring layers to be pressed are formable as auxiliary capacitance lines as well. The spacers can also be functioned as the conductive color layers and electrode transfer members as well.
